

3月20日

微积分, 共3题。

农历二月二, 日落时龙角从东方地平线升起, 像巨龙抬头, 故称“龙抬头”

祝顺利!

1. 求 $\int_{-1}^1 x \ln(1 + e^x) dx$.

$$I = \int_{-1}^0 x \ln(1 + e^x) dx + \int_0^1 x \ln(1 + e^x) dx$$

$$I = \int_{-1}^1 x \ln\left(\frac{1+e^x}{1+e^{-x}}\right) dx = \int_0^1 x^2 = \frac{1}{3}$$

2. 设函数 $f(x)$ 满足方程 $xf(x) + f(1-x) = x^2$, 求 $\int f(x) dx$

$$xf(x) + f(1-x) = x^2 \quad (1)$$

$$(1-x)f(1-x) + f(x) = (1-x)^2 \quad (2) \quad \text{由 (1) (2) 得 } f(x) = \frac{x^3 - 2x + 1}{x^2 - x + 1}$$

$$\text{则 } \int f(x) dx = \int \frac{x^3 - 2x + 1}{x^2 - x + 1} dx$$

$$\text{将 } \frac{x^3 - 2x + 1}{x^2 - x + 1} = \frac{(x^3 - x^2 - x) - 2x + 1 + x^2 - x}{x^2 - x + 1} = x - \frac{x^2 - x + 1 - 3x}{x^2 - x + 1}$$

$$= x - 1 + \frac{2x - 1}{x^2 - x + 1} = x - 1 + \frac{2x - 1}{(x - \frac{1}{2})^2 + \frac{3}{4}}$$

$$\text{故 } \int f(x) dx = \int \left((x-1) + \frac{2x-1}{x^2-x+1} + \frac{1}{(x-\frac{1}{2})^2 + \frac{3}{4}} \right) dx$$

$$= \frac{(x-1)^2}{2} + \ln|x^2-x+1| + \frac{2}{\sqrt{3}} \arctan\left(\frac{2}{\sqrt{3}}(x-\frac{1}{2})\right) + C$$

3. (思考题) 设 $f(t) = \int_0^1 t|t-x| dx$, 求 $\int_{-1}^2 f(t) dt$

$$\textcircled{1} t < 0, f(t) = \int_0^1 t(x-t) dx = \frac{t}{2} - t^2$$

$$\textcircled{2} t > 1, f(t) = \int_0^1 t(t-x) dx = t^2 - \frac{t}{2}$$

$$\textcircled{3} 0 < t < 1, f(t) = \int_0^t t(t-x) dx + \int_t^1 t(x-t) dx = t^3 - \frac{t^2}{2} + \frac{t}{2}(1-t^2) - t^2(1-t)$$

$$= t^3 - t^2 + \frac{t}{2}$$

$$\int_{-1}^2 f(t) dt = \int_{-1}^0 \left(\frac{t}{2} - t^2\right) dt + \int_0^1 \left(t^3 - t^2 + \frac{t}{2}\right) dt + \int_1^2 \left(t^2 - \frac{t}{2}\right) dt$$

$$= -\frac{1}{4} - \frac{1}{3} + \frac{1}{4} - \frac{1}{3} + \frac{1}{4} + \frac{1}{3} \left(7 - \frac{1}{4} \times 3\right)$$

$$= \frac{7}{6}$$
